ACKNOWLEDGEMENT

The COMCEC Transport and Communications Outlook is a contribution of the COMCEC Coordination Office to enrich the discussions during the Transport and Communications Working Group Meetings.

COMCEC Strategy, adopted during the 4th Extraordinary Islamic Summit held in Makkah on 14-15 August 2012, envisages Working Group Meetings as one of the instruments for its implementation. Through the Working Groups, country experts get the chance of elaborating the issues thoroughly in the respective cooperation areas and sharing their good practices and experience. The Working Groups are established for each cooperation area defined by the Strategy, namely (i) Trade, (ii) Transport and Communications, (iii) Tourism, (iv) Agriculture, (v) Poverty Alleviation, and (vi) Finance.

The COMCEC Outlooks are prepared in each cooperation area of the Strategy with a view to explore the global trends and current situation in the OIC Member States in the respective area and enrich discussions during the Working Groups Meetings by providing up-to-date data.

The COMCEC Transport and Communications Outlook 2016 is a revised and updated version of the Transport Outlook 2015 published by the COMCEC Coordination Office. The Outlook has been prepared by Mr. Ekrem KARADEMİR, Mr. Burak KARAGÖL, and Mr. Nihat AKBALIK, specialists at the COMCEC Coordination Office, with the objective of providing general information on the status of transport and communications sector in the Organization of the Islamic Cooperation (OIC) Member States. It dwells on the major issues with regard to developments in transport and communications sectors and makes comparisons with the different country groupings to demonstrate the situation in the Member States and thus cooperation potentials. The authors would like to extend their thanks to Dr. İsmail Çağrı ÖZCAN for his valuable contributions to the previous editions.

The views expressed and conclusions reached in this publication do not necessarily reflect the official views of the COMCEC Coordination Office, COMCEC or the governments of OIC Member Countries.

1. INTRODUCTION

There is a strong emphasis on transportation sector within the OIC (Organization of Islamic Cooperation) framework. First of all, one of three principles of the COMCEC Strategy, which is enhancing mobility, is directly related to transport. Secondly, transportation is explicitly affirmed as one of the three priority sectors by the COMCEC along with agriculture and tourism. Thirdly, it is one of the six cooperation areas specified by the COMCEC Strategy besides trade, tourism, agriculture, poverty alleviation, and finance.

Such an emphasis on the transport sector is not surprising, since it is crucial for economic and social development of the nations. From the point of view of households, people spend considerable time and money for traveling to fulfil a wide variety of purposes such as business, education, shopping, vacation, and socializing. According to Eurostat statistics, transportation activities account for 4.6% of the EU's gross domestic product (GDP) and 4.5% of its total employment (European Commission 2013). In addition, transport expenditures correspond to 13.2% of a household's budget on average within the EU as of 2012 (Eurostat 2012).

Problems and challenges associated with the transport industry are just as big as the transport industry itself. Regarding transportation infrastructure, developed countries try to maintain and improve their transportation network while developing and the least developed countries aim at developing a transport infrastructure to meet their basic needs. With respect to transportation finance and privatization, almost all countries suffer from insufficient public budgets and inefficient provision of transport services through public ownership and management. From environmental point of view, transportation is one of the biggest sources of greenhouse gas emissions and the rate of increase in transport emissions is quite high. In addition to these problems, other outstanding challenges like increasing traffic congestion, problems associated with the transportation safety and security, the lack of transit services are also noteworthy. Revealing these current challenges facing transportation sector, this brief Outlook, through a focused approach, attempts to provide an overview on how OIC countries are performing in terms of transport and telecommunication sector.

The analyses within this Outlook include comparisons between the OIC countries and other regions such as the European Union (EU), Latin America and the Caribbean, East Asia and Pacific, and the Organization for Economic Co-operation and Development (OECD). For more detailed analysis, the OIC countries were divided into geographical regions such as OIC-MENA (Middle East and North Africa), OIC-Asia, and OIC-Sub-Saharan Africa when deemed necessary. Further information on this geographical classification is available at Table A.1 in the Appendix.

Information and communication technologies (ICT) is another critical area for economic and social development of countries. Radical developments in ICT during the second half of the 20th century have significantly changed the way information is gathered, stored, processed and transferred and thus accelerated the process of transformation into information society.

As technologies like telegraph, telephone, radio and television have created unprecedented communication opportunities when they were invented, Internet has deeply affected the ways people communicate.

Internet usage has been rapidly increasing throughout the world. Governments try to develop fixed and mobile internet infrastructures and increase internet usage rates in their countries. However, distribution of both supply of and demand for internet are not evenly distributed across and within countries. Telecommunication section of the Outlook summarizes the developments about telecommunications in the world and OIC countries by representing data on telephone and internet penetration rates.

2. TRANSPORT, LOGISTICS, AND TRADE

The increased per capita income and mobility needs of the households, trade globalization, deregulation and privatization trends in transportation infrastructure and services, and the technological progress in vehicle technology have all contributed to the high growth rate of the transportation industry.

ITF estimates that the trade related international freight will grow by a factor of 4.3 by 2050. Maritime transport is more characterized by movement of freights as almost 85% of global trade is carried by sea in terms of weight. Therefore, increasing international trade will result in unprecedented challenges for the transport infrastructure, especially for ports. According to ITF projections, port volumes are expected to increase nearly fourfold by 2050 (OECD/ITF, 2015). In fact, *Infrastructure to 2030* (OECD, 2012) argues that worldwide container throughput could quadruple even by 2030.

With regard to the surface transport, worldwide road and rail passenger travel is expected to grow around 120% to 230% until 2050, whereas this growth is expected to range from 240% to 450% for non-OECD economies. Besides, the global road and rail freight transport is projected to increase by 230% to 420% (OECD/ITF, 2015).

Infrastructure to 2030 concludes that global transport and distribution infrastructure investment needs, i.e. airports, ports, rail, and oil and gas, may exceed USD 11 trillion over 2009-2030 period. As major infrastructure can take around 10 to 20 years to plan and implement, countries that want to develop their infrastructure at the right time and location will need to get two crucial things right, i.e. national policy frameworks and assured funding (OECD, 2012).

Table 1: Notable developments and trends in transport industry

Transport Mode	Notable challenges and trends
Transport in general	<ul style="list-style-type: none"> Increasing international trade Lack of national policy frameworks Lack of assured public funding Need for increased private-sector investments Aging infrastructure Environmental effects of transportation Deregulation and privatization Oil dependency Terrorism and security concerns
Maritime transport	<ul style="list-style-type: none"> Containerization Increasing vessel sizes Rise of international and regional hub ports Operations of major ports by major shipping lines Trade with China Global crisis Increase of LNG and LPG trade
Air transport	<ul style="list-style-type: none"> Airline alliances Inclusion of aviation into EU ETS Airport privatizations and rise of global airport companies Air cargo: fast, reliable, and cheaper than before Rise of low cost carriers Mergers and acquisitions Fall of state-owned airlines
Road transport	<ul style="list-style-type: none"> Increasing greenhouse gas emissions Congestion in big cities Emphasis on road safety Car dependency
Rail transport	<ul style="list-style-type: none"> Deregulation of rail industry Implementation of high-speed railway network Multimodal trade corridors through rail network

Transport infrastructure is crucial for both economic and social development of the nations and “quality infrastructure is a key pillar of international competitiveness” (OECD, 2012). It is therefore not surprising to see that developing transport infrastructure is assessed as a powerful instrument for a wide variety of policy goals such as reducing logistics costs, poverty (through enhancing rural road infrastructure) and congestion, and enabling the mobility of the workforce, etc. The problems associated with the transport infrastructure vary across the nations. For developed nations, for example, the major transportation problem is to sustain the aging infrastructure in the most cost-effective way and to maintain their competitive power through efficient transport networks. For least developed nations, the major concern is to establish a transportation infrastructure by meeting at least the basic needs.

The variation in the needs of transportation infrastructure across the OIC countries is in parallel with the situation outlined above. On the one hand, there is a group of oil producing gulf countries with high income per capita and relatively smaller areas (except Saudi Arabia). On the other hand, there is a large pool of OIC countries with low income per capita and relatively larger areas, mostly from Sub-Saharan Africa. The Global Competitiveness Report 2016–2017 (WEF, 2016) of the World Economic Forum provides evidence on this gap. Five of the seven best performing OIC countries (i.e. United Arab Emirates (UAE), Malaysia, Bahrain, Qatar, Turkey, Saudi Arabia, and Oman) in terms of quality of transport infrastructure are oil producing gulf countries. On the other hand, nine out of eleven worst performing OIC countries (i.e. Benin, Cameroon, Chad, Lebanon, Mali, Mauritania, Mozambique, Nigeria, Senegal, Sierra Leone, and Yemen) in the same measure are from Sub-Saharan Africa.

Table 2 presents the variation in the quality of transport infrastructure in terms of indexes among the 38 OIC countries (i.e. 13 countries from OIC-Sub-Saharan Africa, 16 from OIC-MENA, and 9 from OIC-Asia). The indexes range from 1 to 7, where 1 represents the extremely underdeveloped infrastructure and 7 stands for extensive and efficient infrastructure by international standards.

Second column of Table 2 shows the indexes for the quality of overall infrastructure (e.g. transport, telephony, and energy) whereas the rest of the columns provide comparable indexes for road, railroad, port, and air transport infrastructure, respectively. One implication of Table 2 is that all of the OIC and OIC-Sub-Saharan Africa averages fall below world averages in every measure. Secondly, OIC-MENA performs better than world average in every measure but the quality of railroad infrastructure. Finally, OIC-Asia underperforms world averages in every measure but the quality of railroad infrastructure.

Table 2: The indexes for the quality of transport infrastructure

Country	Quality of overall infrastructure	Quality of roads	Quality of railroad infrastructure	Quality of port infrastructure	Quality of air transport infrastructure
UAE	6,34	6,50	N/A	6,38	6,75
Malaysia	5,48	5,46	5,06	5,44	5,70

Source: Author from the Global Competitiveness Report 2016–2017 (WEF, 2016)

Transport infrastructure, logistics services, and trade go hand in hand and nations that are able to deliver their products in the cheapest, fastest, and the most reliable way through their efficient logistics infrastructure and services gain competitive advantage in the global trade. That is why, as a historical fact, trade capitals of the world have been those cities and countries with better accessibility and connectivity. The rapid growth of world trade after World War II as a result of decreasing transportation costs (Hummels, 2007) is another implication of the linkage between trade and logistics.

As underlined above, quality of logistics infrastructure and services is a major determinant in terms of shares of countries in the global trade. In this section some important measures with respect to trade and logistics will be analysed to better understand the current situation of the OIC countries.

The most widely used measure for logistics performances of the countries is the World Bank Logistics Performance Index (LPI). As can be seen in Table 3 showing the latest (2016) LPI scores, the OIC countries such as UAE, Qatar, Malaysia, and Turkey come on top of the rankings; while Tajikistan, Sierra Leone, Mauritania, and Somalia come at the bottom.

Table 3: 2016 LPI scores and ranks of the OIC countries

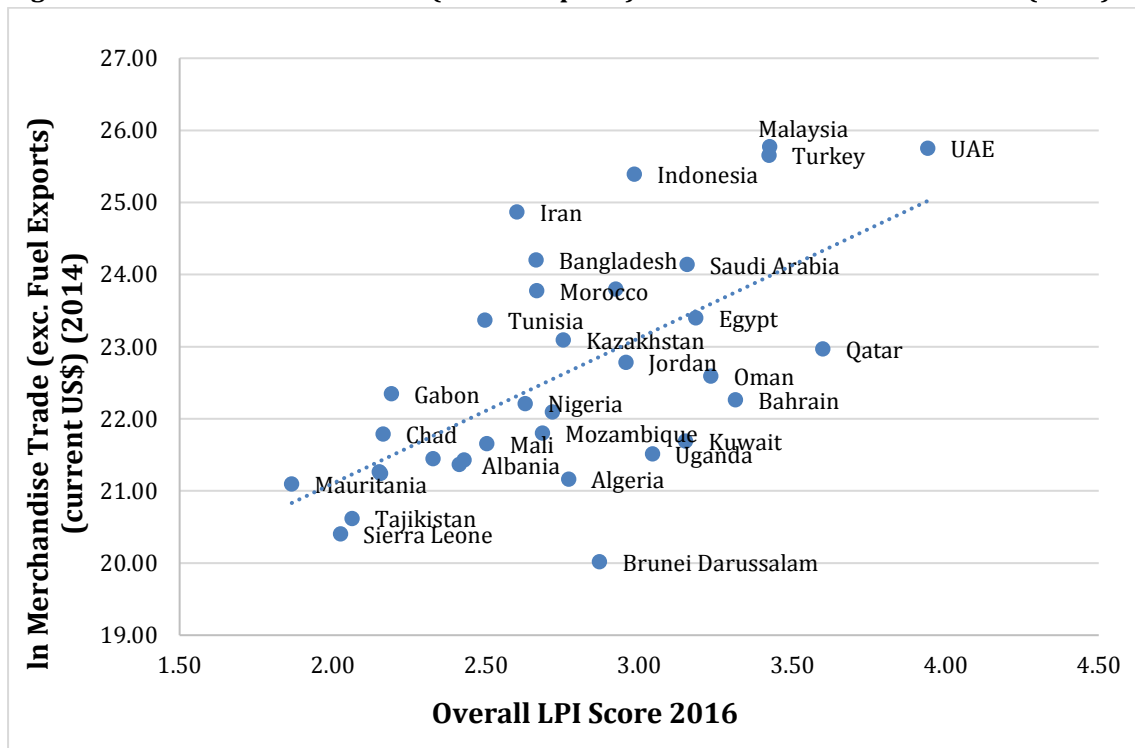

Country	Overall LPI		Customs		Infra-structure		Int. Shipment		Logistics Comp.		Tracking & Tracing		Timeliness

Logistics costs have become more important over time for two main reasons. Firstly, the tendency to shift the production facilities abroad to enjoy lower labour costs necessitates more movement of goods (e.g., raw materials and final products). Secondly, with decreasing tariffs, logistics costs increase in ad valorem terms and turn into an important factor in the prices of products. That is why, the nations which have the aim of increasing their international trade should improve their logistics capabilities.

As an evidence of this fact, Figure 1 shows the LPI scores of the OIC countries for the year 2016 and their respective international merchandise trade (excluding fuel exports) for the year 2014. The figure reveals that there is a positive correlation between the LPI scores and international merchandise trade (excluding oil exports) of the OIC countries. This might imply that if an OIC country has a high LPI score this gives it a competitive advantage over those with lower LPI scores as it can facilitate its international trade through its enhanced logistics infrastructure and services.

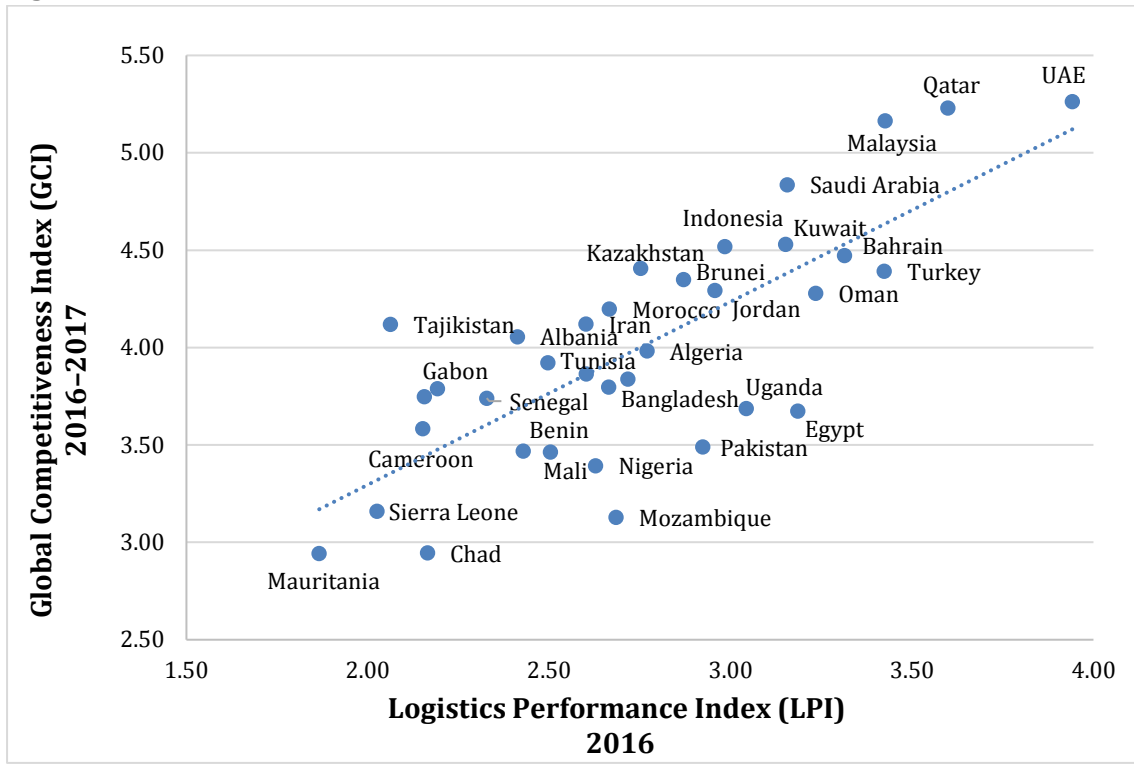

Figure 1: Total merchandise trade (exc. oil exports) and LPI scores in OIC countries (2016)

Source: Author from the World Bank World Development Indicators

Figure 2 shows this relation for the 35 OIC countries where the horizontal axis exhibits the 2016 LPI scores and the vertical axis presents their Global Competitiveness Index (GCI) scores, published by the World Economic Forum (2016), for the period 2016-2017. The figure shows that there is a positive correlation between the LPI and GCI scores of the OIC countries.

Another measure is the World Bank’s Liner Shipping Connectivity Index (LSCI) which aims at capturing a country’s level of integration into the existing liner shipping network. As can be seen in Table 4, the 2016 LSCI scores show that Malaysia (106.8), UAE (70.6), Morocco (64.7), and Egypt (62.5) are well connected to the global shipping network whereas Albania (3.9), Brunei (4), Guinea Bissau (4.5), and Guyana (4.9) are least connected.

One implication of Table 4 is that the best performing countries have large transshipment ports (e.g. Malaysia, Morocco, and Egypt) and gateway ports (e.g. Malaysia, Saudi Arabia, and Turkey). Secondly, the least performing countries are either not located on the main liner shipping services or lack the physical and operational capacity to serve large container ships (COMCEC, 2015).

Table 4: LSCI scores for OIC Member States, exc. landlocked countries

Country	2011	2012	2013	2014	2015	2016
Malaysia	90.96	99.69	98.18	104.02	110.58	106.79

Figure 3 provides, on average, the LSCI changes for the OIC-groupings between 2004 and 2016. As the figure suggests, in terms of average LSCI scores, OIC-MENA region performed better than OIC-Asia region as well as the world starting from 2008. On the other hand, average LSCI scores for OIC-Sub-Saharan Africa region remained well below the world averages throughout the same period.

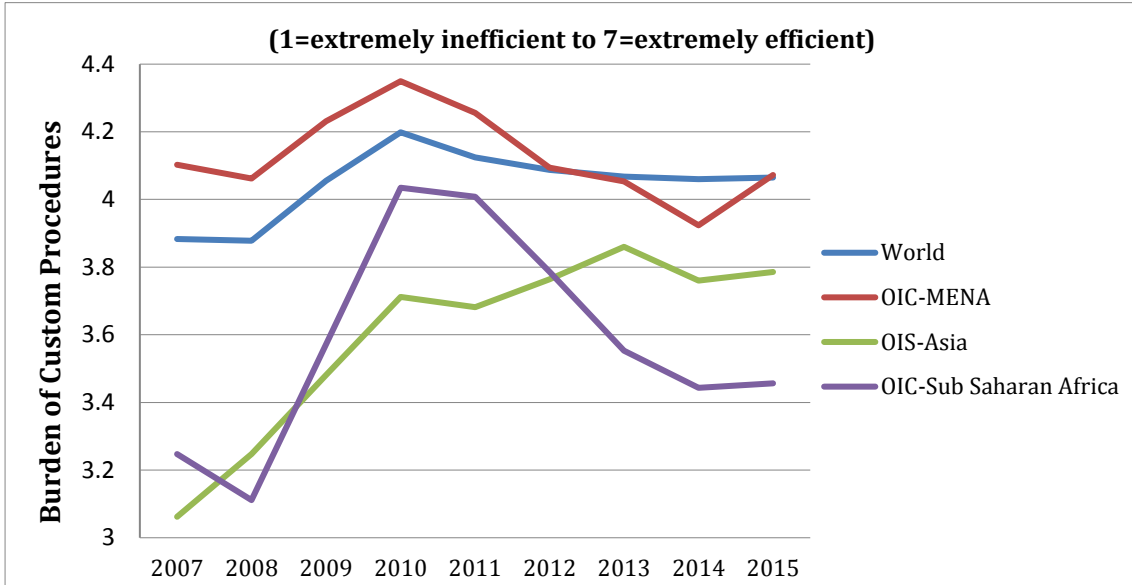

Figure 3: Average liner shipping connectivity scores by OIC regions (2004-2016)

Source: Author from UNCTAD Statistical Database

Lastly, custom procedures were analysed for the three OIC regions as they directly affect trade facilitation. For this purpose, burden of custom procedures index, which is provided by the World Bank, were examined on a scale of 1 to 7, where 7 corresponds to the extremely efficient case. Figure 4 reveals that although it fell behind the world averages between 2012 and 2014, OIC-MENA has been the best performing OIC region for the 2007-2015 period in terms of efficiency of custom procedures. Although OIC-Asia has experienced a steady growth throughout this period both OIC-Asia and OIC-Sub-Saharan Africa had custom efficiency scores below the world average.

Figure 4: Average burden of custom procedure scores by OIC regions (2007-2015)

3. TRANSPORT BY MODES

As most of the transportation textbooks underline, transportation is a derived demand. People use transportation services to go work, to visit their relatives and friends, to go shopping, etc. That is why, the change in the transportation activities can be used as a proxy for changes in overall economic activities. The rise in the container traffic, for example, is a perfect indicator of the growth in the trade and manufacturing industry. On the other hand, the change in the air passenger traffic can reveal how some high-tech and service based industries, which rely more on air travel, are performing.

The changes in the transport and traffic figures may also signal some other aspects of the transportation system. The continuously growing traffic figures at an airport, for example, may imply that a capacity expansion may be needed in the near future. On the other hand, relatively stable traffic figures of a port may reveal a physical bottleneck which becomes a barrier for further traffic growths.

In the following sections, the current of state among the OIC geography will be provided with regard to four transport modes, i.e. road, rail, maritime, and air transport.

3.1. ROAD TRANSPORT

Roads are an important public asset; improving the road network can bring about immediate and large benefits by providing better access to hospitals, schools, and markets; improved comfort, speed, and safety; and lower vehicle operating costs. Not surprisingly, the road network in most OIC countries is not in a very good condition. The analyses below point to a need for further development of the road networks in the OIC Member Countries. To begin with, Table 5 gives data on the socio-economic and road network indicators in the OIC countries.

Table 5: Socio-economic and Road Network Indicators

Indicator	Min	Max	Average
Population (m)	0.345	250	29
	(Maldives)	(Indonesia)	
GNI per capita (\$)	400	86,790	5,676
	(Niger)	(Qatar)	
Motorways (km)	0	3,891	590
	(Albania)	(Saudi Arabia)	
Highways, main roads (km)	0	38,570	11,534
	(Suriname)	(Indonesia)	
Secondary or regional roads (km)	0	113,451	21,505
	(Togo)	(Egypt)	
Other roads (km)	0	415,788	69,807
	(Suriname)	(Indonesia)	
Total length of roads (km)	88	508,000	68,227
	(Maldives)	(Indonesia)	
Paved roads (%)	1	100	52
	(Chad)	(Jordan)	
Paved roads (km)	88	355,220	35,740
	(Maldives)	(Turkey)	
Non-paved roads (km)	0	220,074	31,423
	(Jordan)	(Indonesia)	
Length of roads by GDP per/c (km/\$)	0.03	300	49
	(Maldives)	(Uganda)	
Density of roads (km/km²)	0.005	5.6	0.32
	(Sudan)	(Bahrain)	

Source: COMCEC, *Enhancing Road Maintenance in the OIC Member States, 2016*.

Figure 5 gives the proportion of the road network that is: a motorway; highway, main or national road; secondary or regional road; and other roads. What is clear from this picture is that with the exception of Afghanistan, a large share of the road network in most OIC countries is made up of secondary or regional roads, or other roads. However, on comparing the composition of the road network in the OIC countries as a group to the road networks in the United States, and the European Union as a whole, it is worth noting a big difference in the composition of the road networks in these three categories. It is striking to see that a large percentage of the total road networks in OIC countries are motorways and highways.

Figure 5: Percentage of Road Type (Motorway, Highway, Secondary, Other) by Country

Source: COMCEC, Enhancing Road Maintenance in the OIC Member States, 2016.

Table 6 shows that in OIC countries the proportion of the road network that is a motorway, highway, main, or national road is almost 12.8% compared to 1.4% for the US, and 6% for the EU. This finding suggests that the OIC Member States, as a group, are investing more in developing motorways and highways, and not investing in developing their secondary, regional and other roads. This focus on developing high-quality and high-volume roads requires large amounts of capital. Given the limited resources that are available in many OIC Member States, it is very likely that this focus results in insufficient resources being allocated to maintenance activities.

Table 6: Percentage of Road Categories in OIC Countries, USA and the EU

Type of Road	OIC (%)	US (%)	EU (%)
Motorways	0.42	1	1
Highways, main, or national	12.4	0.4	5
Secondary or regional	22	28.6	25
Other	65	70	69

Source: COMCEC, *Enhancing Road Maintenance in the OIC Member States, 2016*.

Figure 6 gives the density (the length of road network divided by the area of the country) of the road networks in the OIC countries. This figure shows several things. First, there is a large variation in the density of the road networks in the different OIC countries. Albania, Bahrain, Bangladesh, Brunei, Comoros, Gambia, Indonesia, Kuwait, Lebanon, Malaysia, Maldives, Pakistan, Palestine, Qatar, Turkey, and Uganda have more dense networks compared to the remaining countries. Actually, Bahrain is among the top 5 countries in the world regarding this indicator. However, for some countries the low density of the road network reflects the geography of the country. For example, in Saudi Arabia, a very large part of the country is a desert with little to no habitation. The density of the road networks in the OIC countries as a group and individually, is quite low compared to the US and the EU which is not surprising. For the OIC countries the density of the road network is 0.12 compared to 0.67 and 1.34 for the US and the EU, respectively.

Figure 6: Length of Road Network (km) / km² Area of Country

Source: COMCEC, *Enhancing Road Maintenance in the OIC Member States*, 2016.

Figure 7 gives the length of the road network in km per USD 10 million GDP. Figure 7 shows that the size of the road network relative to the country's GDP is, compared to the US and the EU, higher in all OIC countries except for Bahrain, Egypt, Gabon, Guyana, Indonesia, Iran, Iraq, Jordan, Kuwait, Lebanon, Maldives, Morocco, Palestine, Qatar, Saudi Arabia, Somalia, Tunisia, and Turkey. For the OIC as a whole, the length of the road network per USD 10 million GDP is about 27. For the US and the EU this number is 3.9 and 6.4, respectively. This is an important observation insofar that it suggests that many of the OIC countries have road networks that are too large for the size of their economy. Obviously, this has clear implications for the maintenance of the road networks as well, i.e. the resources to properly maintain the road networks in these countries is going to be limited.

Figure 7: Length of Road Network (km) / USD 10 million GDP

Source: COMCEC, *Enhancing Road Maintenance in the OIC Member States*, 2016.

Figure 8 shows the length of the road network relative to the country's population. Road network per capita can be considered as a proxy for measuring the extent of service by roads to any person in a country. All OIC countries (except Oman, Libya, Suriname, Brunei, Saudi Arabia, Albania, and Malaysia) have fewer than 6 km of roads per 1,000 population. At the individual country level, Oman registered the highest level of road length, 14.26 km per 1,000 people. Road network per capita in the OIC Member States is relatively low compared to developed countries as well as the world average. The OIC countries as a whole have 3.12 km of roads per 1,000 population compared to 20.7 and 11.6 for the US and EU, respectively. What this would suggest is that the length of the road network is inadequate to serve the population. Yet at the same time, compared to the US and the EU, the road networks in OIC countries are too large relative to GDP, and the proportion of the motorways, highways, national and main roads is also too high.

Figure 8: Length of Road Network (km) / 1,000 Population

ROAD SAFETY IN OIC MEMBER COUNTRIES¹

Table 7 provides mortality statistics for countries in each of the three OIC regions; i.e. MENA, Asia, and Sub-Saharan Africa. An interesting, and somewhat surprising result of Table 7 is the relatively high mortality rate of five of the six high income (>15,000 US\$) OIC member countries. UAE, Qatar, Kuwait, Oman and Saudi Arabia all have mortality rates that are significantly higher than what would be expected in high income countries internationally. Of the high income countries, only Bahrain has a mortality rate marginally below the expected norm. Turkey as a middle income country also has a lower mortality rate than expected. Since these data do not take into account important factors, such as the degree of motorisation (and amount of travel), the results must be viewed with some caution. Although it is generally accepted that most high income countries are highly developed with a high degree of motorisation, this is not always the case. Countries such as Bahrain may be defined as high income, but are yet to experience associated growth in motorisation and transport infrastructure development.

This analysis reveals that Saudi Arabia is a particularly interesting case with a mortality rate about three times higher than the international norm. A possible explanation may be found in the GINI index. For instance, Qatar, which is also a high income country with a somewhat higher than expected traffic mortality rate, has a GINI coefficient of 41.1%, which is not extraordinary high but 1.5 times higher than developed countries, such as Norway and the Netherlands.

Of the middle income countries (between 1,300 US\$ and 15,000 US\$ per capita), Libya and Iran have remarkably high road mortality rates. The data for Libya reveal extremely high mortality rates and should be treated with caution. Libya's road mortality (734 per million) is some seven times higher than what would be expected from an average middle income country and is more than twice the value of the subsequent country, which is Iran. In Iran, the mortality rate is half of Libya's and double that what is expected from a country with its per capita income level.

A third relevant group is the group of middle income countries and high population with a relatively high mortality, i.e. Iran, Nigeria, Morocco, Algeria, Gabon, Lebanon, Kazakhstan, Malaysia, Turkmenistan, Iraq, Suriname, Tunisia and Jordan. The mortality rate in these countries may well be affected by factors, such as increased motorisation and urbanisation.

Most of the remaining middle income countries have a somewhat lower road mortality rate. In these cases this could be explained by lower levels of motorisation. Increased affluence may result in increased demand for travel and rising car ownership which could negatively impact the mortality rates in countries such as Afghanistan, Bangladesh and Pakistan.

A next group is formed by most of the remaining low income countries, that almost all have a high road mortality. For these countries, road mortality is not notably higher than the average for all countries; yet, their mortality is still high which may offer opportunities to improve safety.

¹ For a detailed account; see COMCEC, "Improving Road Safety in the OIC Member States", 2016.

Table 7: Road Safety in OIC member countries

	Country	GDP/c (current US\$)	Income group	Estimated road deaths annually	Mortality rate [deaths/100,000 pop.]

RAIL TRANSPORT

Rail transportation had been the major transport mode especially for most of inland cities for decades. However, expanding network of roads and improvements in aircraft and road vehicle technology increased the stiff competition from air and road transport. As a result, rail transport has become more freight-oriented over time. Today, rail passenger operations are in general financially viable only at some high-speed and commuter lines whereas other rail passenger lines are generally subsidized by the governments.

Figure 9 gives the rail network density (the length of rail network divided by the area of the country) of the OIC countries. Again, there is a large variation in the density of rail networks in the different OIC countries. Almost all OIC countries (except Djibouti, Azerbaijan, Tunisia, Bangladesh, Albania, Turkey, Syria, and Pakistan) have fewer than 1,000 km of rail lines per 100,000 km² land area, while almost half of the OIC countries have no railway network. Djibouti with its 781 km of rail lines has the highest rail network density, i.e. 3,369 km per 100,000 km², among the OIC countries due to its relatively small land area. In comparison, Kazakhstan, with its 14,329 km rail length, which ranks it top among the OIC countries, has only a density of 531 km per 100,000 km², due to its very large land area. Average network density of the OIC countries is equal to 426 km of railway per 100,000 km² land area, which accounts almost half of that of developing economies, which averages at 740 km.

Figure 9: Rail network density (km/100,000 km² land area)

Source: Author from the World Bank World Development Indicators

Figure 10 shows the length of the rail network relative to the country's population. As in the case of road network, rail network per capita can be considered as a proxy for measuring the extent of service by railways to any person in a country. All OIC countries (except Djibouti, Kazakhstan, Turkmenistan, Gabon, Tunisia, and Azerbaijan) have fewer than 200 km of rail lines per million population. At the individual country level, Djibouti and Kazakhstan registered the highest level of rail network per capita, i.e. 880 and 817 km per million population, respectively. Average rail network per capita of the OIC countries is equal to 92 km per million population while the world average is 164 km. This suggests that the length of the rail network is inadequate to serve the OIC population, even without taking into consideration that almost half of the OIC countries have no railway network.

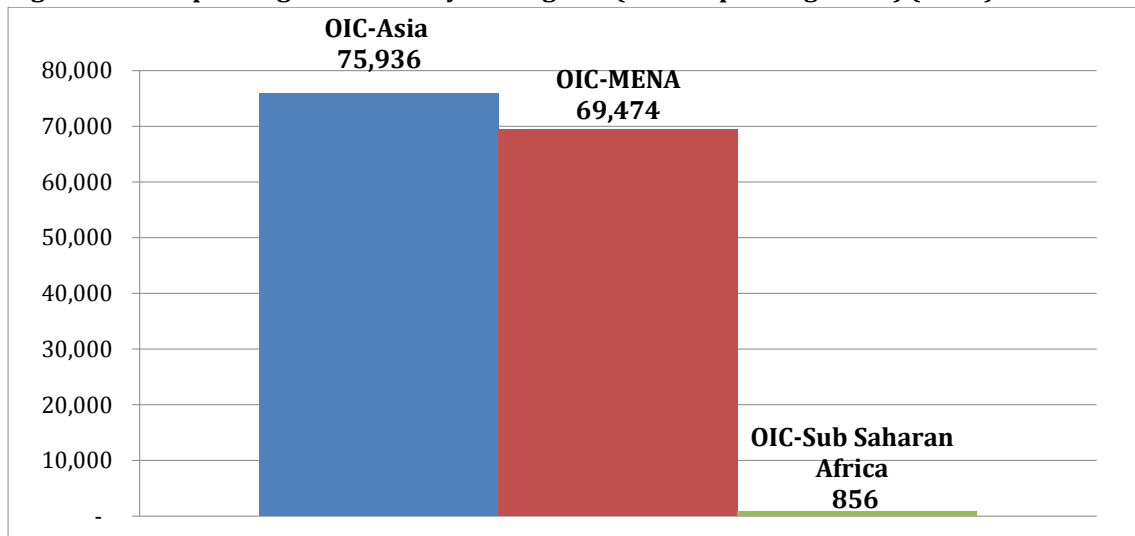

Figure 10: Rail network density ((km/million population)

Source: Author from the World Bank World Development Indicators

Figure 11 reveals that OIC-Sub-Saharan Africa has very low share compared to the OIC-MENA and OIC-Asia regions in terms of rail passengers carried in 2014. Egypt and Iran from the OIC-MENA region and Pakistan, Indonesia, and Kazakhstan from the OIC-Asia are the leading member states with regard to rail passengers.

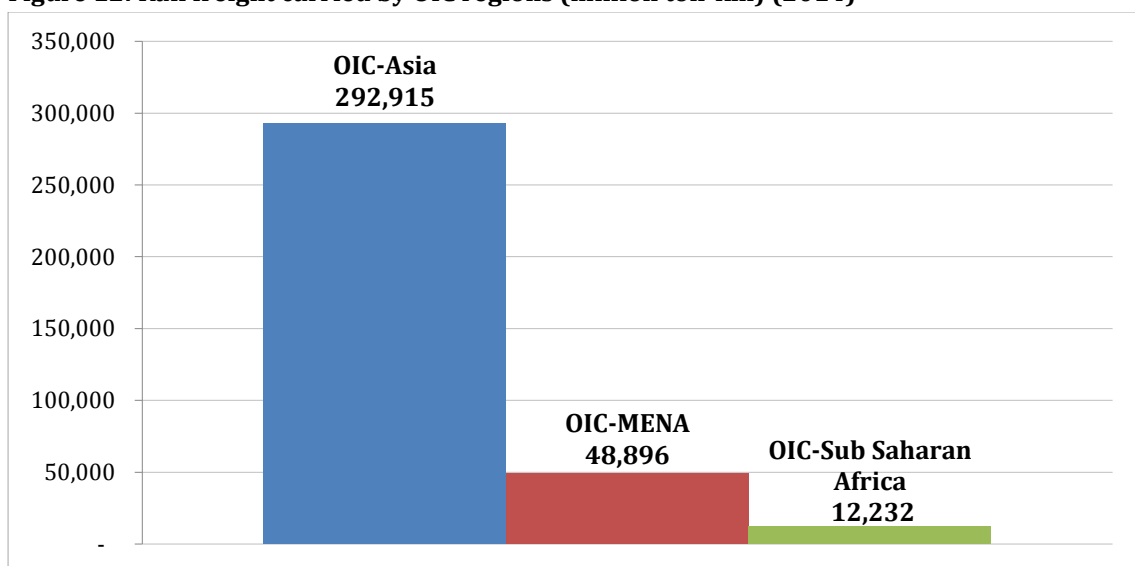

Figure 11: Rail passengers carried by OIC regions (million passenger-km) (2014)

Source: Author from the World Bank World Development Indicators

As Figure 12 shows, rail freight carried in the OIC-Asia region, which predominantly belongs to Kazakhstan, is far above other regions in 2014. In the OIC-MENA region, Iran and Turkey together carried more than two-thirds of region’s rail freight.

Figure 12: Rail freight carried by OIC regions (million ton-km) (2014)

3.2. MARITIME TRANSPORT²

While all modes of transport are important, maritime transport needs special attention given that almost 85% of global trade is carried by sea in terms of weight and thus ports can account for a significant proportion of trade logistics and transport costs. (COMCEC, 2015)

A measure that can be used as a proxy for the international trade is the change in global fleet. Figure 13 shows, using UNCTAD data, the change in the total fleet, in dead weight tons in thousands, by flag of registration for the 1998-2016 period. During this 19-year period, world fleet has increased 134% while only one subgroup, i.e. developing economies, outperformed this global average with a growth of 191%. The OIC countries failed to catch up with the world average in fleet growth and increased their fleet only by 55%. Similarly, the League of Arab States (LAS) fell below the world average and grew its fleet only by 22%.

Figure 13: Change in total fleet by flag of registration (in 1000 dwt) (1998-2016)

Source: Author from UNCTAD Statistical Database

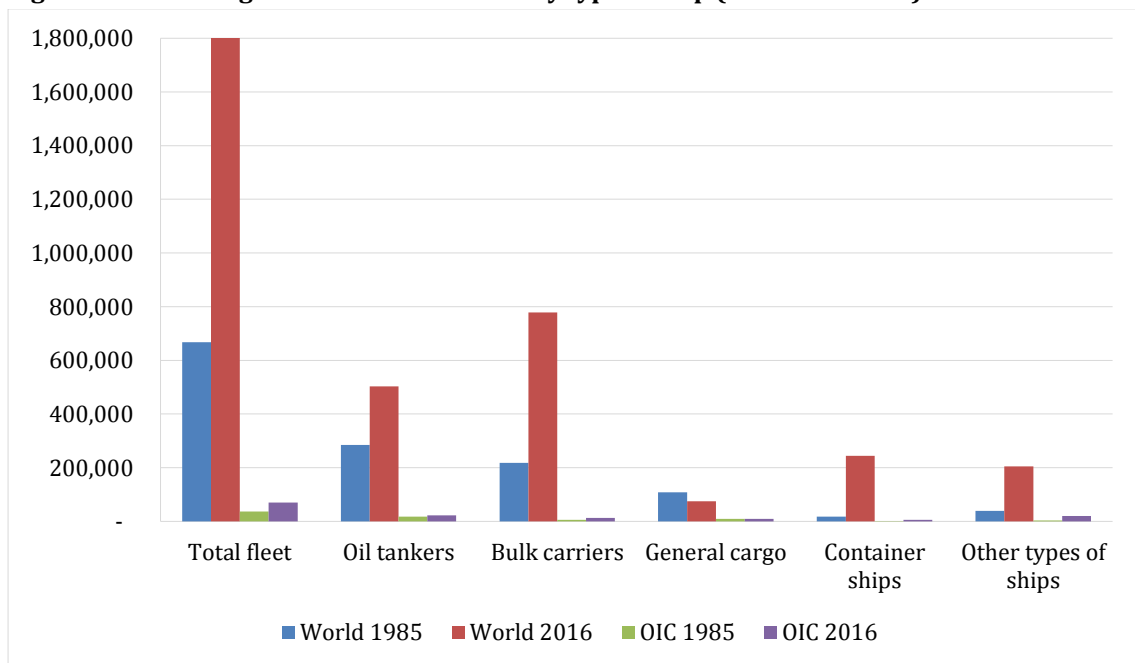

The increase in the commercial fleet registered under the flags of the OIC Member States corresponds to a total capacity of 70.5 million deadweight tons (dwt) in 2016 compared with 37 million dwt in 1985. The majority of the fleet consist of oil tankers whereas container ships represent only 8.2% of the total fleet. With regard to their share of the world’s fleet, the commercial fleet of the OIC countries represents 3.9% in 2016 which was 5.5% 31 years ago. Considering the comparatively higher share of the OIC countries in the world trade, i.e. around

² For a more detailed account on the subject, see COMCEC, “Evaluating the Ownership, Governance Structures and Performances of Ports in the OIC Member Countries”, 2015.

10%, than that of the fleet capacity, it can be concluded that the majority of the OIC's merchandise trade is being carried by foreign shipping companies. Although such a situation is a common trend in today's globalized shipping industry, this often leads to high maritime transport costs and low shipping connectivity particularly for the OIC countries with smaller economies located in remote locations (COMCEC, 2015).

Figure 14 compares the share of OIC fleet in the global fleet by ship's type in 1985 and 2016, respectively. The figure reveals that the OIC's share of general cargo ships is currently 12.5% of the world's general cargo fleet, while the OIC share in the global bulk and tanker fleet is only 1.7% and 4.4%, respectively. This is surprising considering the trade in many OIC countries are mainly dominated by bulk and fuel commodities (COMCEC, 2015).

Figure 14: OIC and global commercial fleet by type of ship (1985 and 2016)

Source: Compiled by the author from UNCTAD Statistical Database

Between OIC countries, there is a great disparity in ship ownership and operation. In 2016, OIC-MENA countries dominated fleet ownership with holding 67% of the total OIC fleet. Turkey had the largest commercial OIC fleet with a total tonnage of 28 million dwt. Other countries with large fleets include Iran (17.8 million dwt), Indonesia (17.3 million dwt), Malaysia (16.8 million dwt), and the UAE (15.5 million dwt). At the other end of the scale, some OIC countries have no commercial fleet (i.e. Afghanistan, Benin, Burkina Faso, Côte d'Ivoire, Chad, Comoros, Guinea Bissau, Mali, Niger, Tajikistan, Togo, Kyrgyz Republic, and Uzbekistan); while others (i.e. Gambia, Gabon, Senegal, Suriname, Djibouti, Guinea, and Sierra Leone) have negligible tonnage despite the importance of their maritime trade related sectors.

Table 8: Commercial fleet in OIC countries by beneficial ownership (1,000 dwt) (2016)

Among other categories of cargo, the container transport deserve particular attention and is the major maritime focus in this report. The invention of the container was arguably the most important transportation advance of the 20th century. The container has revolutionized the global trade like the semiconductor has changed information and communication systems. Thanks to the deployment of freight containers in multimodal chains of transport, efficiency of logistics are increased, logistics costs are reduced, less goods are damaged, and security of shipments is strengthened. (COMCEC, 2014) “The container has made the world smaller as the transit time between origins and destinations of cargo flows has declined, and it made the world larger as the container ensures to integrate even the remotest region into world trade. It is therefore no wonder that the container has become the icon of globalism.” (COMCEC, 2013)

Containerization has been the main stimulant in increasing container fleet capacity. In parallel with this trend, the growth in container fleet outpaced that of total fleet and the world container fleet has been almost quadrupled in 19 years, between 1998 and 2016. As can be seen in Figure 15, the increase in the OIC container fleet has been similar to that of the world during the same period, which was not the case for total fleet.

Figure 15: Change in container fleet by flag of registration (in 1,000 dwt) (1998-2016)

Source: Author from UNCTAD Statistical Database

Nevertheless, the total share of container shipping companies from the OIC countries, which is less than 3% of the global container shipping market, does not mirror OIC’s share in world trade. Table 6 shows that major container shipping companies in the OIC countries are mainly from the UAE and Indonesia which are followed by Iran and Turkey. “However, those statistics must be interpreted with caution given the ownership and operational features of the global container

shipping industry. For instance, the Turkish conglomerate Yildirim Group has, as of November 2014, a 24% stake in CMA-CGM, the 3rd largest container shipping line. At the same time, container liners in some OIC countries such as Indonesia and Malaysia are more focused on domestic and regional trade, while other OIC countries still retain high public stakes in national shipping companies.” (COMCEC, 2015)

Table 9: Major container shipping companies in the OIC countries

Country	Operator	Global rank	TEU	Ships
UAE	UASC	18	338,872	53

Ports are critical logistics infrastructure facilities and play a key role in the international trade. There are over 200 OIC ports that serve as either gateway or transshipment facilities, and sometimes as transit points to other landlocked OIC countries. Ports are of critical importance for integration of the OIC countries into global markets as well as among themselves given that some OIC countries have smaller economies located in remote locations. Indeed, some OIC ports have a strategic importance for global trade due to their positions on the international maritime routes or services to large hinterland markets. However, there are also many OIC countries that are landlocked, i.e. Afghanistan, Azerbaijan, Burkina Faso, Chad, Kazakhstan, Kyrgyz Republic, Mali, Niger, Tajikistan, Uganda, and Uzbekistan; while some others that are Small Island Developing States (SIDS), i.e. Comoros, the Maldives, and Suriname.

The container throughput of the OIC countries has reached 101 million TEU in 2014 up from 79.8 million TEU in 2010. However, the share of OIC countries in the global container throughput has remained flat at around 15% in the 2010-2014 period. Both Malaysia and the UAE show high volume throughput with 22.7 million TEU and 20.9 million TEU, respectively. On the other hand, majority of the OIC countries couldn't even reach the one million TEU threshold. In the Maldives, Mauritania, Albania, and Brunei, very low container throughput volumes reflect the small size of the port sector in those countries.

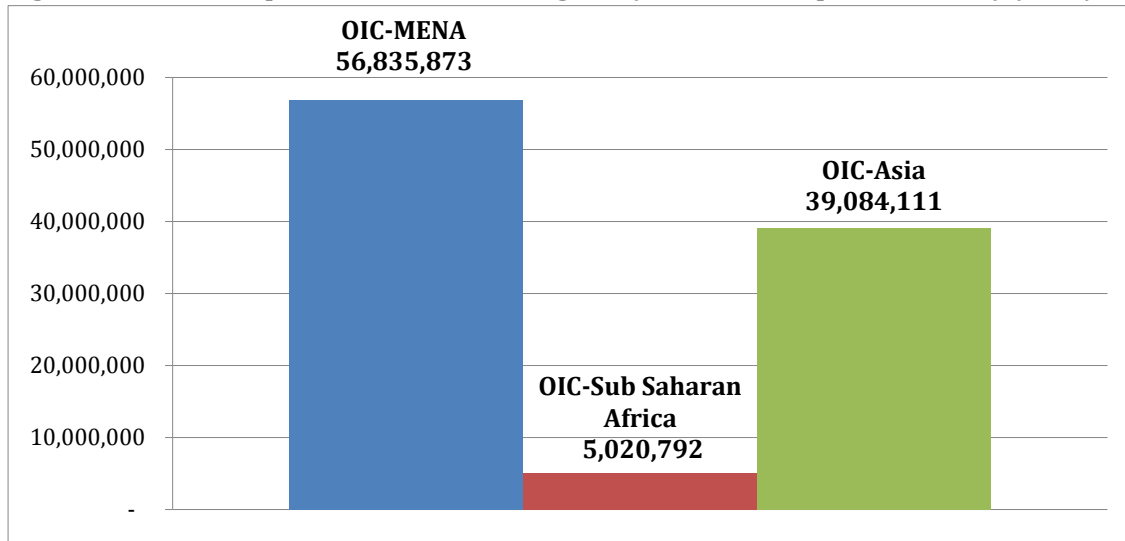

Table 10: Container-port throughput in the OIC countries (TEU)

Country	2010	2011	2012	2013	2014
Malaysia	18,267,475	20,139,382	20,873,479	21,168,981	22,718,784

Figure 16 provides distribution of the container port traffic among the OIC regions in 2014. As the figure shows, the OIC-MENA region outperforms other regions in terms of container port traffic. In the OIC-MENA region UAE, Egypt, and Turkey were the top performers regarding container throughput. For the OIC-Asia region most of the traffic were handled by a few countries such as Malaysia and Indonesia. It should also be underlined that the scope of the container port traffic is very limited in the OIC-Sub-Saharan Africa.

Figure 16: Container port traffic in the OIC regions (TEU: 20 foot equivalent units) (2014)

Source: The World Bank World Development Indicators

As of 2014, the container penetration intensity (share of containerisation in break bulk and general cargo traffic) in several OIC countries were many times lower than the rate for the global market (~100 TEU per 1,000 capita), and far lower than that of developed countries (~230 TEU per 1,000 capita). Especially, some OIC countries such as Nigeria, Algeria, and Bangladesh show very low container volumes in comparison with the size of their economies and populations as Table 11 reveals. On the other hand, a few OIC countries (e.g. UAE and Oman) have very high container penetration levels although their figures should be readjusted to account for their high transshipment traffic.

Table 11: Container trade penetration in the OIC countries (2014) (including transshipment)

Country	TEU/1,000 capita	Country	TEU/1,000 capita
UAE	2,300	Iran	66

3.3. AIR TRANSPORT

There is a large variation in the air traffic figures between the OIC Member States. On the one hand, several OIC countries achieve highest air traffic globally. As can be seen in Table 12, there are four airports from the OIC region that are ranked in the top 30 busiest airports in terms of passenger transport and again four airports in terms of air cargo traffic.

Table 12: OIC airports ranked in the top 30 (2013)

PASSENGER		CARGO	
City (Airport)	Passengers	City (Airport)	Metric Tonnes
Dubai, UAE	66,431,533	Dubai, UAE	2,435,567
Jakarta, Indonesia	60,137,347	Doha, Qatar	883,264
Istanbul, Turkey	51,304,654	Kuala Lumpur, Malaysia	713,254
Kuala Lumpur, Malaysia	47,498,127	Abu Dhabi, UAE	712,488

Source: Author from Airports Council International

On the other hand, several OIC member countries lack an operating airport and accordingly fail to experience any air traffic movement. As can be seen in Table 13, among all OIC countries, Turkey, Indonesia, and UAE had the highest air passenger traffic in 2015. In terms of geographical classification, Turkey, UAE, and Saudi Arabia in the MENA; Nigeria, Togo, and Mozambique in the Sub-Saharan Africa; and Indonesia, Malaysia, and Pakistan in the Asia were the top three OIC member countries with highest air passenger movement. Nevertheless, almost two thirds of the air passengers is carried at MENA region while one third is carried at Asia.

Table 13: Air passengers carried at the OIC Member States (2015)

MENA		Sub-Saharan Africa		Asia	
Turkey	96,604,665	Nigeria	3,223,460	Indonesia	88,685,767
UAE	84,738,480	Togo	769,905	Malaysia	50,347,150

Regarding the number of air passengers throughout the 1993-2015 period, Figure 17 reveals that OIC-MENA outperformed other regions since 1993 while OIC-Sub-Saharan Africa remained well below the other regions during this period.

Figure 17: Total air passengers carried in the OIC regions (1993-2015)

Source: Author from the World Bank World Development Indicators

In general, more populous countries tend to have higher air passenger traffic. In addition, the income level, geographical position and the availability of alternative transport modes affect the level of air passenger traffic in that country. For example, higher per capita income countries are more likely to have higher per capita air passenger traffic. Similarly, it is possible to observe that island countries where surface transport linkages are quite limited have higher per capita air passenger traffic figures. To analyse the linkage between population and air passenger movements for the OIC Member States, the air passenger movements of the member states were normalized with their populations. In this regard, Table 14 presenting the ratios of air passengers carried to the populations of each member state has several implications. Firstly, in parallel to the theory, the high income gulf countries such as Qatar, UAE, and Bahrain and island states like Brunei Darussalam and Malaysia have higher per capita air passenger traffic figures. Secondly, the OIC countries with dominant network airlines are more likely to experience higher per capita air passenger traffic. Thanks to their well-established hub-and-spoke system, large network airlines such as Turkish Airlines and Emirates can achieve higher economies of scale and thus enjoy higher per capita air passenger traffic.

Table 14: Per capita air passengers carried at the OIC Member States (2015)

MENA		Sub-Saharan Africa		Asia	
Qatar	11.302	Togo	0.105	Brunei Darussalam	2.717

Figure 18 shows the changes in the air freight traffic among the OIC regions between 1993 and 2015. One implication of Figure 18 is that air freight traffic in the OIC-Sub-Saharan Africa has been quite premature and fell well below the other regions during this period. It is also noteworthy that there is an exponential growth of air freight traffic in the OIC-MENA region since 1993.

As a result of the boom, OIC-MENA has experienced an about 13-fold increase in its air freight traffic between 1993 and 2015 whereas OIC-Asia only less than doubled its air freight traffic during the same period. When the aggregate data is decomposed, it is seen that the boom of air freight traffic in the OIC-MENA region mostly originated from UAE.

Figure 18: Total air freight carried in the OIC regions (million ton-km) (1993-2015)

Source: Author from the World Bank World Development Indicators, adjusted for missing data

4. ENVIRONMENTAL EFFECTS OF TRANSPORT SECTOR

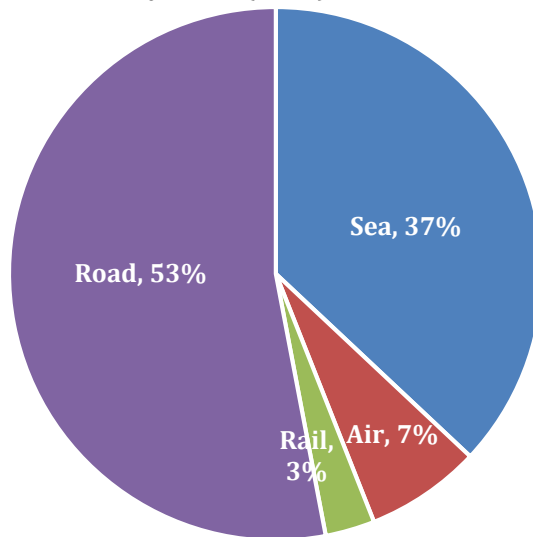

Transport emissions have been rising over time in parallel with the increase in transport demand. As Figure 19 shows, with regard to CO₂, the most emitted GHG, transportation accounted for 23% of global CO₂ emissions, which makes it the second largest CO₂ emitter, preceded by electricity and heat generation (42%) and followed by industry (19%) in 2013 (OECD/IEA, 2015). Figure 20 reveals that with regard to international trade related CO₂ emissions by transportation mode, road transportation dominates CO₂ emissions by 53% and it is followed by maritime transport (37%), air transport (7%), and rail transport (3%).

Figure 19: World CO₂ emissions by sector (2013)

Source: OECD/IEA (2015)

Figure 20: International trade related CO₂ emissions by mode (2010)

Source: OECD/ITF (2015)

Though it is likely to observe some variations depending on the domestic fuel prices and the availability of alternative energy sources, higher per capita income countries tend to emit more GHG per capita. Figure 21 shows that there is a positive correlation between transport-related CO₂ emissions and GDP per capita (PPP) in the OIC countries. One reason for this tendency is the increased private car ownership with increasing per capita income, which eventually increases personal trips and accordingly GHG emissions. Another implication of the figure is that the countries with higher GHG emissions are mostly from oil producing countries, which often corresponds to lower pump prices for gasoline and consequently more road sector energy consumption.

Figure 21: Transport CO₂ emissions and GDP per capita (PPP) in OIC Countries (2014)

Source: Author from World Energy Council

Further analysis on road passenger transportation regarding the linkage between transport and environment is necessary for two reasons. Firstly, road transport accounts for almost three-quarter of all transport GHG emissions and passenger transportation is the determinant factor. Secondly, available data generally lack comparable statistics on road freight transport but cover road passenger transport statistics.

As noted earlier above, higher per capita income countries tend to emit more GHG per capita and this generalization is valid for the transport GHG emissions as well. Although several other factors, such as existing road infrastructure, alternative public transport opportunities, existing parking policies, personal security concerns, and the urban sprawl, are also influential; the personal income and the prices of the fuels are the two major determinants (in addition to car prices) for private car ownership and use. To begin with 'per capita income', Figure 22, which depicts the change in road sector energy consumption per capita with respect to per capita income, shows the comparable relation for 37 OIC countries. As the figure suggests, the OIC countries with higher per capita income are more likely to consume more road sector energy per capita. The top OIC countries (i.e. Qatar, Kuwait, UAE, Saudi Arabia Oman, and Bahrain) with highest per capita income are also the top road sector energy consumers per capita.

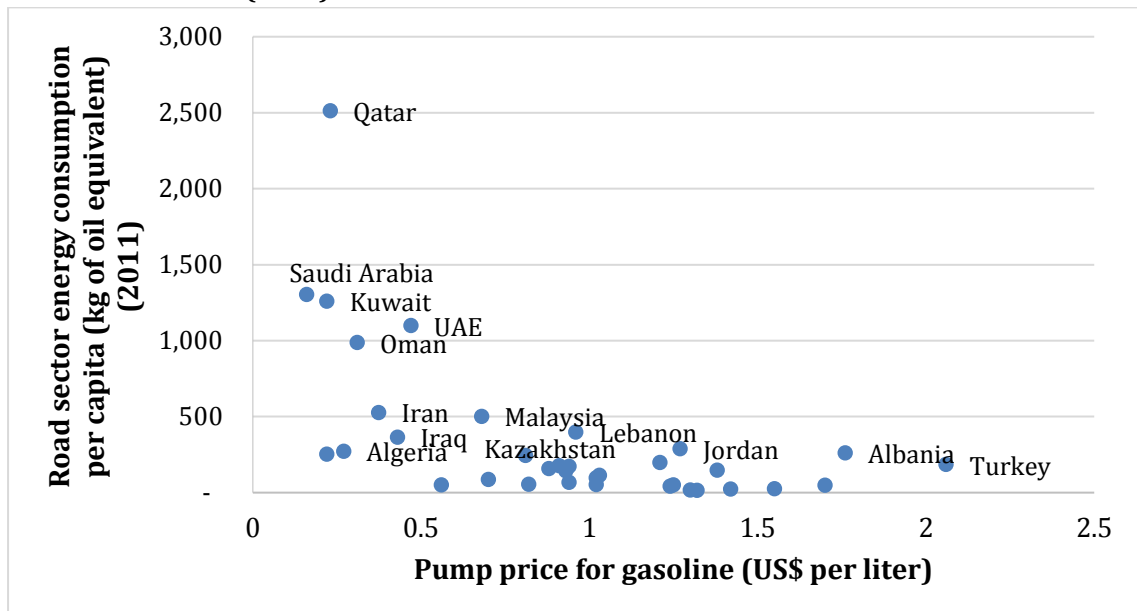

Figure 22: Road sector energy consumption and income per capita in OIC countries

Source: Author from the World Bank World Development Indicators

The pump price for gasoline is also a major determinant for road sector GHG emissions. Figure 23 shows that a negative relation exists between pump price for gasoline and road sector energy consumption in 35 OIC countries in 2011 (which can be used as a proxy for GHG emissions).

Figure 23: Road sector energy consumption per capita and pump price for gasoline in the OIC Member States (2014)

Options to mitigate transportation-related GHG emissions

Public policy actions aiming at reducing the transportation-related GHG emissions of transport activities involve one or more of the following measures and as any other public policy action, each measure has its own advantages or disadvantages:

- **Enhancing fuel efficiency:** Using less fuel to travel the same amount of distance will help reduce GHG emissions. To achieve this, one option is to use smaller vehicles. Second option is to increase engine efficiency and employing lighter but still safer materials. The drawback of this option is that more fuel-efficient vehicles may stimulate higher vehicle-kilometres which may partially off-set the fuel savings.
- **Using alternative fuels:** This option involves using more environmentally friendly alternative fuels such as biofuels, natural gas, and electricity. However, using more of these alternative energy sources have their own drawbacks. An increase in biofuel (such as ethanol and biodiesel) use will not only threaten food security as it is likely to increase food prices, but also increase water use and contribute to the nitrous oxide (N₂O) emission through fertilizer use. Regarding natural gas and electricity, there is still a large room to develop more efficient, affordable and safer cars using these alternative fuels.
- **Adopting environmental pricing:** Following the polluter pays principle which suggests that a pricing mechanism should be established in a way that the polluters must bear the cost of the pollution they cause, environmental pricing schemes in transportation include some forms of taxing the travellers. The easiest way to implement an environmental pricing scheme is increasing the gasoline taxes. Though mainly aiming at reducing congestion, congestion pricing can also be classified as another form of environmental pricing.
- **Shifting from private car use to environmentally-friendly transport modes:** The most environmentally-friendly transportation mode is non-motorized travel and it does not only help reduce GHG emissions, but also contribute to congestion relief and improve public health and leads to better land use practices. The costs associated with non-motorized travel, on the other hand, are increasing travel times and accident rates. Public transit through buses, light rail system, and metro can also help reduce surface transport GHG emissions. However, especially light rail system and metro require high infrastructure investments, and transit operations may require state subsidy since transit revenues generally fail to cover transit expenses.
- **Adopting traffic restrictions:** While reducing traffic congestion is the major motivation for adopting this option, traffic restrictions are also expected to help handle transport GHG emissions. Traffic restrictions involve driving bans based on number plates, high occupancy vehicle lanes, congestion pricing schemes, and new plate quotas. These policies are difficult to implement politically and may raise equity concerns.

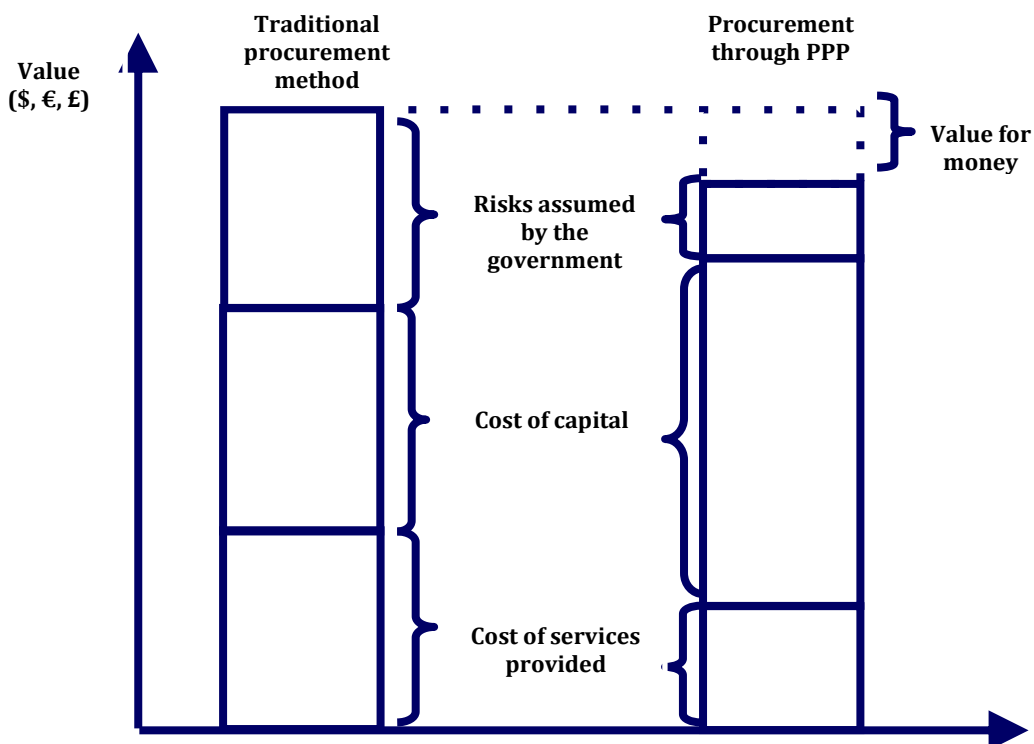

5. PRIVATIZATION IN TRANSPORT

Network industries necessitating big infrastructure investments such as transportation, telecommunication, energy, and water and sewerage have been traditionally state-owned and -operated for two major reasons. Firstly, huge initial investments created a barrier to entry for private investors. Secondly, because of the economic and social importance of such industries, governments preferred to keep them under state ownership. However, poor performances of state ownership and operations, such as low operating efficiency, labour redundancy, politically motivated tariff setting, and underinvestment, initiated a tendency to appeal to private finance and management.

Where the real benefit of a PPP project lies?

To make a comparison between the traditional public procurement and public procurement through PPP models, we can divide the total value of a project into three: (1) the cost of services provided, (2) the cost of capital, and (3) the risks assumed by the government (Figure 24).

Figure 24: The comparison of traditional public procurement with PPP procurement

Source: Moriarty (2006)

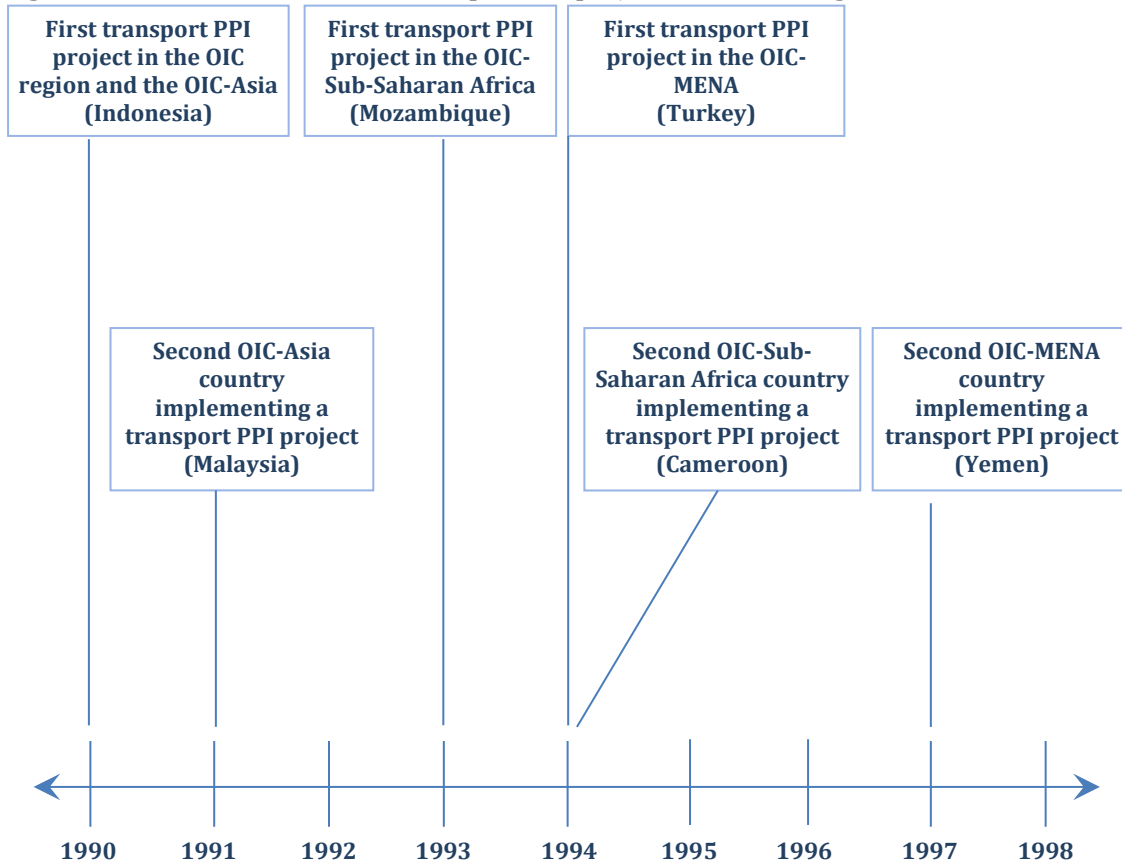

Regarding cost of capital, state procurement is generally more advantageous than PPP-type procurement because cost of borrowing of a private entity is generally higher than that of public sector, given generally high risks inherently involved in PPP projects. On the other hand,

advantages of PPP-type procurement arise by regarding cost of services provided and risks assumed by the government. It is generally expected that private sector can achieve more cost savings during implementation of investments and provide cheaper services than public sector can. In addition, during PPP-type procurement, private sector assumes that some of risks, such as construction, availability, and demand risks associated with projects which public sector assumes in traditional procurement. For a PPP model to be eligible, value of money must be achieved, which means that sum of benefits- from cost savings for services provided and risks transferred from public sector to private one -should exceed costs associated with higher cost of capital of private sector.

Initially and substantially adopted by the United Kingdom, within the last couple of decades, public-private partnerships (PPPs) - including private participation in infrastructure (PPIs) - today play an important role in provision of public infrastructure and services. It doesn't matter if the country is developed, developing or a least-developed one, governments use various PPP models, ranging from management contracts to Build-Own-Operate model and divestitures, mainly; (1) to attract private finance to their infrastructure projects in face of large budget deficits, (2) to improve efficiency and quality of services provided, and (3) to liberalize their economy.

In fact, the OIC geography has been quite familiar with private participation in large transport infrastructure projects. Opened in 1869, Suez Canal was a typical Build-Operate-Transfer project for which the private operator had obtained a concession to operate the canal for 99 years. Other transportation concessions during the Ottoman Empire era included the Port of Istanbul, Port of Izmir, Istanbul Rail Tunnel, and Istanbul Streetcar (Yılmaz, 1996). Some sources (Tiong, 1990; Handley, 1997; Özdoğan and Birgönül, 2000) cite that even the term Build-Operate-Transfer was coined by Turgut Özal, the former prime minister and the president of Turkey. In the 20th century, the first transport PPI project in the OIC geography was implemented in Indonesia in 1990 and it was followed by a second PPI project in Malaysia in 1991. The first PPI project in OIC-Sub-Saharan Africa and OIC-MENA were implemented in Mozambique in 1993 and in Turkey in 1994. Figure 25 presents the timeline of the initial transport PPI projects in the OIC regions.

Figure 25: Timeline of the initial transport PPI projects in the OIC region

Source: Author from the World Bank PPI Database

However, past experience of the OIC region on PPP applications calls for major improvements. A successful implementation of a PPP project requires; (1) political and economic stability, (2) sound legal framework, (3) institutional capacity, (4) political commitment and support, (5) transparent and competitive tender procedures free from corruption, (6) an organized and developed domestic private entrepreneurship (including financial institutions and construction companies), and (7) public acceptance and support. Unfortunately, the OIC countries generally fail to achieve most of these preconditions.

Distribution of PPI Projects by sector and region

In this section, a brief analysis on the historical PPP trends and what OIC countries have been doing about transportation PPPs/PPIs will be provided.

The World Bank PPI database, which covers 139 low and middle-income countries, provides the most comprehensive data on PPI projects and classifies them into 4 main sectors; (1) energy, (2) telecom, (3) transport, and (4) water and sewerage. Table 15 shows that, financial closure of a total of 7,389 PPI projects has been finalized in the world between 1991 and 2015. Energy

sector had the largest share (47.4%) in terms of number of PPI projects and it was followed by transport sector (22.4%).

Table 15: Distribution of PPI projects by infrastructure sectors (1991-2015)

Sectors	Number of PPI projects	Percentage shares
Energy	3,505	47.4%
Telecom	849	11.5%
Transport	1,655	22.4%
Water and sewerage	1,380	18.7%
Total	7,389	100.0%

Source: Author from the World Bank PPI Database

Table 16, which presents the distribution of PPI projects by their PPI-types during the 1991-2015 period shows that some variations in PPI-type exist depending on the characteristics of individual sectors. Table 16 shows that greenfield projects have been the most frequently used PPI type in energy and telecom sectors whereas transport sector mostly adopted brownfield. On the other hand, both energy and telecom sectors applied divestitures more frequently than transport and water and sewerage sectors in both absolute and percentage terms. In addition, water and sewerage sector used management and lease contracts more than any other sector did. Among various PPI types, greenfield projects have been the most common form of PPI investment in the transport sector with a share of 62.4% whereas 22.9% of the transport PPI projects has been implemented through brownfield schemes. Divestitures and management and lease contracts had relatively lower shares, i.e. 10.6% and 4.2%, respectively.

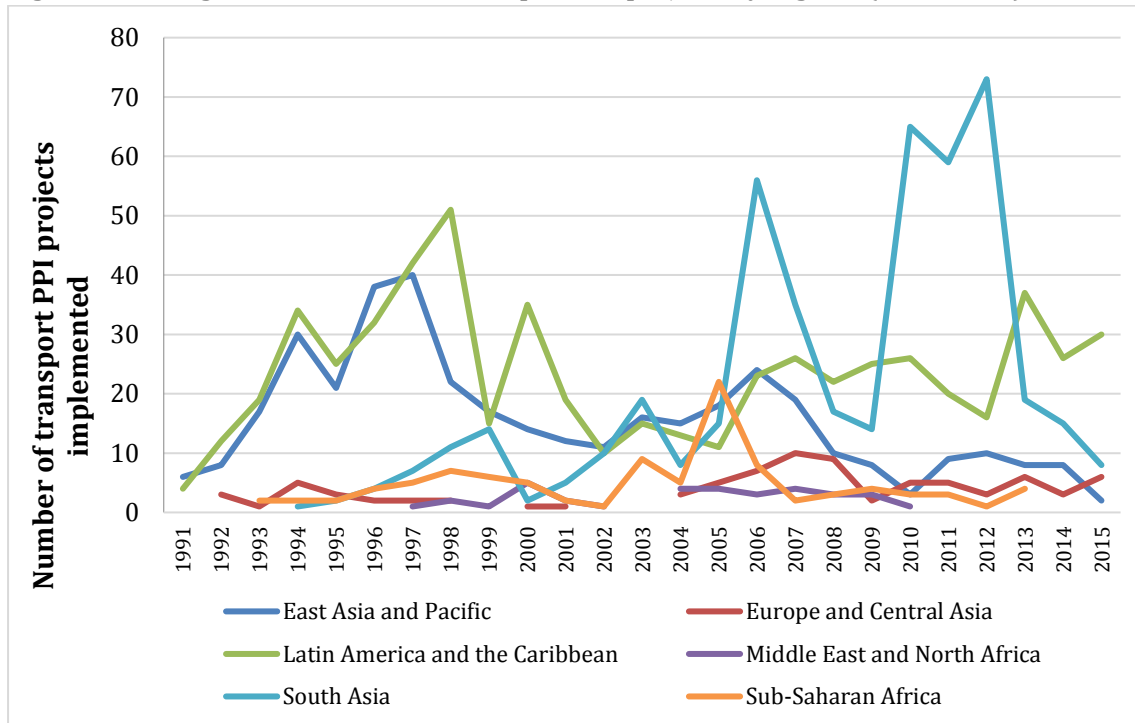

Table 16: Distribution of the PPI projects by PPI-types (1991-2015)

Sector	Brownfield	Divestiture	Greenfield project	Management and lease contract	Total
Energy	217	445	2,793	50	3,505
Telecom	8	190	641	10	849
Transport	982	72	517	84	1,655
Water and sewerage	384	30	386	146	946
TOTAL	1,591	737	4,337	290	6,955

Source: Author from the World Bank PPI Database

The changes in the number of transport PPI projects by geographic regions in the 1991-2015 period are presented in Figure 26. In terms of using PPI models in transport projects, South Asia - with an increasing trend in recent years - and Latin America and the Caribbean are the two best performing regions whereas Middle East and North Africa and Sub-Saharan Africa remained at the bottom of the figure. Another interesting feature of the figure is its fluctuant pattern as a result of regional and global crises which proves that PPI/PPP implementation has been quite sensitive to economic stability.

Figure 26: Changes in the number of transport PPI projects by regions (1991-2015)

Source: Author from the World Bank PPI Database

With respect to the distribution of transport PPI projects by modes, for roads the PPI projects outnumbered others with a share of 55.3% while seaports, railroads, and airports had the shares of 26.3%, 7.7%, and 10.7%, respectively. Table 17 provides the global transport PPI project counts and their respective shares with regard to transport modes.

Table 17: Distribution of global transport PPI projects by modes (1991-2015)

Subsector	Project Count	% Project Count	Total Investment Commitments (billion \$)	% Total Investment
Airports	177	10.7%	102.28	19.0%
Railroads	127	7.7%	94.17	17.5%
Roads	915	55.3%	261.36	48.7%
Seaports	436	26.3%	79.12	14.7%
Total	1655	100.0%	536.94	100.0%

6. TELECOMMUNICATIONS

Communication is an essential activity for mankind to survive and progress. Telecommunication has provided individuals with invaluable communication opportunities. Telecommunication is defined as “any transmission, emission or reception of signs, signals, writing, images and sounds or intelligence of any nature by wire, radio, optical or other electromagnetic systems (International Telecommunication Union, 1982). Invention of technologies like telegraph, telephone, radio, television and more recently computer and internet has radically changed the ways people communicate.

Today, information and communication technologies (ICT), especially internet, are used by almost all sectors for different purposes and trigger technological improvements and innovation. ICT enables the use of physical, social, financial and intangible assets more efficiently and consequently creates productivity gains. ICT based R&D and innovation activities as well as ICT driven transformations in other sectors result in significant economic benefits. Firms and countries who own and utilize these technologies can gain competitive advantage.

Diffusion of ICT alters business models, organization structures and functioning of the job market. As ICT is widely employed in economic activity, some of the jobs, professions and business activities are either modified or replaced by new ones. Transfer of many transactions and applications to the digital environment and dissemination of new applications such as e-commerce, e-banking, e-health, e-learning, etc. provide significant advantages by removing some of the traditional barriers, especially physical and time constraints. Furthermore, ICT changes people’s daily lives including their habits, way of entertainment and communication methods. Similarly, public administration and delivery of public services are affected and improved by diffusion of ICT.

Internet has a special importance among other information and communication technologies. Internet is the main platform on which most of the other ICT products and services operate. Therefore, internet is an essential element for realization of abovementioned transformations and advantages. Internet usage has been rapidly increasing throughout the world. Governments try to develop fixed and mobile internet infrastructures and increase internet usage rates in their countries. However, distribution of both supply of and demand for internet are not evenly distributed across and within countries. Generally, richer countries and regions have higher internet availability and usage rates. As a result, significant differences among individuals, firms and countries in accessing and effectively using ICT, i.e. digital divide, arise.

6.1. OVERVIEW OF TELECOMMUNICATIONS IN THE WORLD

As significant and rapid technological developments occur, dominant choices for telecommunication change. While fixed telephony was an indispensable way of communication a few decades ago, mobile phones and then the Internet have come into prominence.

As can be seen in Figure 27, fixed telephone subscriptions per 100 people reached its peak globally in 2005 with a value close to 20 percent and then it started to decrease rapidly. This downward trend occurred in all country income groups. While this decrease was observed in high income countries earlier, others followed later.

Figure 27: Fixed telephone subscriptions (per 100 people) (1975-2013)

Source: World Bank

As seen in Figure 28, as opposed to downward trend in fixed telephony, there is a steep upward trend in mobile telephony. As of 2014, mobile cellular subscriptions per 100 people were 122, 96 and 56 percent for high, middle and lower income countries respectively.

Figure 28: Mobile cellular subscriptions (per 100 people) (1980-2014)

Source: World Bank

In addition to increase in the number of internet users, types and nature of online activities are also continuously changing. New technology and applications such as online video streaming, voice over IP, machine to machine communication and telecommunication trends like convergence result in increased data usage and higher speed requirements. These developments eventually increase the demand for bandwidth, which represents the transmission capacity of a telecommunication device or system, i.e. the amount of data that can be transformed in a given time period. This increasing bandwidth demand creates the need for “broadband” internet.

As Figure 29 illustrates, fixed broadband subscriptions have been rapidly increasing, especially in high income countries. Global average of fixed broadband subscriptions per 100 people was about 11 in 2014 while the same figure was only 3 ten years ago. On the other hand, while average broadband subscriptions per 100 people exceeded 30 percent in high income countries, it is just 0.2 percent in low income countries.

Figure 29: Fixed broadband subscriptions (per 100 people) (2000-2014)

Source: World Bank

Internet usage throughout the globe has been rapidly increasing. While the total number of internet users in the world was about 1 billion in 2005, it reached 3.2 billion in 2015. Internet usage rate reached 83 percent in 2014 in high income countries, while it was 35 and 6.5 percent for middle and lower income countries respectively. Similar to fixed broadband subscriptions, there is a huge difference between high and low income countries in terms of internet usage and this gap is not diminishing, if not growing. This divide poses a serious threat of deepening existing social and economic inequalities.

Figure 30: Internet users (per 100 people) (1990-2014)

Source: World Bank

6.2. TELECOMMUNICATIONS IN THE OIC MEMBER COUNTRIES

OIC member countries usually have lower telephone and internet penetration rates and tend to stay in the disadvantaged side of digital divide. On the other hand, there are significant differences among OIC countries in terms of penetrations. While there are some OIC countries with rates close to or even above high income countries, others have only a negligible level of telephone and internet penetration. Detailed telecommunication statistics for OIC countries can be seen in Table A.3 in the Appendix.

As Table 18 indicates, Iran is the leading OIC country in terms of fixed-telephone penetration with 38.27 percent and followed by Kazakhstan and UAE.

Table 18: Fixed telephone subscriptions (per 100 people) in top 5 OIC countries

Country	Fixed-telephone subscriptions per 100 inhabitants
Developed Countries	38.50
Iran	38.27
Kazakhstan	24.70
UAE	23.06
Bahrain	20.52
Lebanon	19.19
World Average	14.30
Developing Countries	9.30
OIC Average	7.68

Source: International Telecommunication Union Statistics, 2015

As seen in Table 19, several OIC countries have much higher mobile cellular penetration rates compared to developed countries' average. Kuwait and Maldives followed by UAE, Kazakhstan and Bahrain are the OIC countries with the highest mobile cellular penetration rates.

Table 19: Mobile cellular subscriptions (per 100 people) in top 5 OIC countries

Country	Mobile-cellular telephone subscriptions per 100 inhabitants
Kuwait	231.76
Maldives	206.66
UAE	187.35
Kazakhstan	187.17
Bahrain	185.26
Developed Countries	125.70
OIC Average	108.77
World Average	98.60
Developing Countries	93.00

Source: International Telecommunication Union, 2015

OIC countries are generally in a less favorable position in terms of internet penetration compared to fixed and mobile telephony. Average of fixed broadband penetrations among the OIC countries is just 4.28 percent and this is much lower than world average, which is 11.2 percent. Lebanon, Azerbaijan and Bahrain are the leading OIC countries in terms of fixed broadband subscriptions per 100 people.

Table 20: Fixed broadband subscriptions (per 100 people) in top 5 OIC countries

Country	Fixed-broadband subscriptions per 100 inhabitants
Developed Countries	29.40
Lebanon	22.76
Azerbaijan	19.76
Bahrain	18.61
Kazakhstan	13.05
UAE	12.81
World Average	11.20
Developing Countries	7.40
OIC Average	4.28

Source: International Telecommunication Union, 2015

Bahrain, Qatar and UAE are the best performing OIC countries in terms of internet usage rates with values above 90 percent. However, average of internet usage rates among OIC countries is still lower than world average as well as developing countries average.

Table 21: Internet users (per 100 people) in top 5 OIC countries

Country	Percentage of Individuals using the Internet
Bahrain	93.48
Qatar	92.88
UAE	91.24
Kuwait	82.08
Developed Countries	78.10
Azerbaijan	77.00
World Average	43.80
Developing Countries	36.70
OIC Average	35.29

Source: International Telecommunication Union, 2015

7. CONCLUDING REMARKS

This Outlook aims at providing a brief picture of the transport and telecommunication sector in the OIC countries.

The analysis reveals that there is a positive correlation between the LPI scores and international merchandise trade (excluding oil exports) as well as the GCI scores of the OIC countries. This might imply that if an OIC country has a high LPI score this gives it a competitive advantage over those with lower LPI scores as it can facilitate its international trade through its enhanced logistics infrastructure and services. According to the 2016 LPI scores, among the OIC countries, UAE, Qatar, Malaysia, and Turkey come on top of the rankings, while Tajikistan, Sierra Leone, Mauritania, and Somalia come at the bottom.

World Bank's Liner Shipping Connectivity Index (LSCI) scores of the OIC countries, which aims at capturing a country's level of integration into the existing liner shipping network, show that Malaysia, UAE, Morocco, and Egypt are well connected to the global shipping network whereas Albania, Brunei, Guinea Bissau, and Guyana are least connected. In terms of average LSCI scores, OIC-MENA region performed better than OIC-Asia region as well as the world starting from 2008. On the other hand, average LSCI scores for OIC-Sub-Saharan Africa region remained well below the world averages.

One implication of this is that the best performing countries have large transshipment ports (e.g. Malaysia, Morocco, and Egypt) and gateway ports (e.g. Malaysia, Saudi Arabia, and Turkey). On the other hand, the least performing countries are either not located on the main liner shipping services or lack the physical and operational capacity to serve large container ships.

With regard to burden of custom procedures, both OIC-Asia and OIC-Sub-Saharan Africa fell below world averages for the 2007-2015 period, whereas OIC-MENA is an exception with its recent progress.

With respect to transport infrastructure, OIC overall and OIC-Sub-Saharan Africa averages fell below the world averages for every transport infrastructure measure according to the Global Competitiveness Report while OIC-Asia performed better than world averages only in the quality of railroad infrastructure. OIC-MENA, on the other hand, is the best performing OIC region which outperforms all the world averages except the quality of railroad infrastructure. Five of the seven best performing OIC countries (i.e. UAE, Malaysia, Bahrain, Qatar, Turkey, Saudi Arabia, and Oman) in terms of quality of transport infrastructure are oil producing gulf countries. On the other hand, nine out of eleven worst performing OIC countries (i.e. Benin, Cameroon, Chad, Lebanon, Mali, Mauritania, Mozambique, Nigeria, Senegal, Sierra Leone, and Yemen) in the same measure are from Sub-Saharan Africa.

A large share of the road network in most OIC countries is made up of secondary or regional roads, or other roads. However, on comparing the composition of the road network in the OIC countries as a group to the road networks in the United States, and the European Union as a whole, it is worth noting a big difference in the composition of the road networks in these three categories. It is striking to see that a large percentage of the total road networks in OIC countries are motorways and highways.

In OIC countries the proportion of the road network that is a motorway, highway, main, or national road is almost 12.8% compared to 1.4% for the US, and 6% for the EU. This finding suggests that the OIC Member States, as a group, are investing more in developing motorways and highways, and not investing in developing their secondary, regional and other roads. This focus on developing high-quality and high-volume roads requires large amounts of capital. Given the limited resources that are available in many OIC Member States, it is very likely that this focus results in insufficient resources being allocated to maintenance activities.

Besides, for the OIC as a whole, the length of the road network per USD 10 million GDP is about 27. For the US and the EU this number is 3.9 and 6.4, respectively. This is an important observation insofar that it suggests that many of the OIC countries have road networks that are too large for the size of their economy. Obviously, this has clear implications for the maintenance of the road networks as well, i.e. the resources to properly maintain the road networks in these countries is going to be limited.

Yet at the same time, the OIC countries as a whole have 3.12 km of roads per 1,000 population compared to 20.7 and 11.6 for the US and EU, respectively. This might suggest that the length of the road network is inadequate to serve the population.

Regarding road safety, statistics reveal that, UAE, Qatar, Kuwait, Oman and Saudi Arabia all have road mortality rates that are significantly higher than what would be expected in high income countries internationally. Of the high income countries, only Bahrain has a mortality rate marginally below the expected norm. Besides, of the middle income countries, Libya and Iran have remarkably high road mortality rates. For many OIC countries, road mortality seems high which may offer opportunities to improve safety.

Regarding rail network density, all OIC countries (except Djibouti, Azerbaijan, Tunisia, Bangladesh, Albania, Turkey, Syria, and Pakistan) have fewer than 1,000 km of rail lines per 100,000 km² land area, while almost half of the OIC countries have no railway network. Djibouti with its 781 km of rail lines has the highest rail network density, whereas, Kazakhstan, has the largest rail network with 14,329 km.

All OIC countries (except Djibouti, Kazakhstan, Turkmenistan, Gabon, Tunisia, and Azerbaijan) have fewer than 200 km of rail lines per million population. At the individual country level, Djibouti and Kazakhstan registered the highest level of rail network per capita. Average rail network per capita of the OIC countries is equal to 92 km per million population while the world

average is 164 km. This suggests that the length of the rail network is inadequate to serve the OIC population, even without taking into consideration that almost half of the OIC countries have no railway network.

Regarding the rail freight transport, statistics show that rail freight carried in the OIC-Asia region predominantly belongs to Kazakhstan and is far above other regions. In the OIC-MENA region, Iran and Turkey together carried more than two-thirds of region's rail freight.

Regarding total fleet growth, the OIC countries fell below the world average between 1998 and 2016 while container fleet growth has been similar to that of the world during the same period. Nevertheless, the share of shipping companies from the OIC countries, does not reflect OIC's share in global trade. In terms of LSCI scores, despite a decrease in 2016, from 2007 on, OIC-MENA performed better than OIC-Asia and world averages while the last two kept pace with each other throughout the 2004-2016 period.

The container throughput of the OIC countries has reached 101 million TEU in 2014 up from 79.8 million TEU in 2010. The OIC-MENA region outperforms other regions in terms of container port traffic. In the OIC-MENA region UAE, Egypt, and Turkey were the top performers regarding container throughput. For the OIC-Asia region most of the traffic were handled by a few countries such as Malaysia and Indonesia. It should also be underlined that the scope of the container port traffic is very limited in the OIC-Sub-Saharan Africa.

The data shows that the share of OIC countries in the global container throughput has remained flat at around 15% in the 2010-2014 period. Both Malaysia and the UAE show high volume throughput with 22.7 million TEU and 20.9 million TEU, respectively. On the other hand, there are also many OIC countries which are landlocked, i.e. Afghanistan, Azerbaijan, Burkina Faso, Chad, Kazakhstan, Kyrgyz Republic, Mali, Niger, Tajikistan, Uganda, and Uzbekistan. Besides, majority of the OIC countries couldn't even reach the one million TEU threshold.

The container penetration intensity in several OIC countries were many times lower than the rate for the global market and far lower than that of developed countries. Especially, some OIC countries such as Nigeria, Algeria, and Bangladesh show very low container volumes in comparison with the size of their economies and populations.

Regarding air transport, Turkey, Indonesia, and UAE has the highest air passenger traffic. In terms of geographical classification, Turkey, UAE, and Saudi Arabia in the MENA; Nigeria, Togo, and Mozambique in the Sub-Saharan Africa; and Indonesia, Malaysia, and Pakistan in the Asia were the top three OIC member countries with highest air passenger movement. Almost two thirds of the air passengers is carried at MENA region while one third is carried at Asia.

The high per capita air passenger movements in the high-income countries, such as Qatar, UAE, and Bahrain, and in the island countries, such as Brunei Darussalam and Malaysia, are also noteworthy. Thanks to their well-established hub-and-spoke system, large network airlines

such as Turkish Airlines and Emirates can achieve higher economies of scale and thus enjoy higher per capita air passenger traffic.

For the environmental effects of transportation, statistics reveal that OIC countries with high per capita income tend to emit more transport-related CO₂. The OIC countries with higher per capita income are more likely to consume more road sector energy per capita. The top OIC countries (i.e. Qatar, Kuwait, UAE, Saudi Arabia Oman, and Bahrain) with highest per capita income are also the top road sector energy consumers per capita. Such situation is not peculiar given that richer countries have more private cars and thus more personal trips. In addition, lower pump prices for gasoline might stimulate more per capita road sector energy consumption in the OIC geography.

As for privatization of transportation and PPPs/PPIs, brownfield projects has been the most widely used PPI-type in the world. With regard to both project counts and total project costs, road PPI projects outnumbered other transport modes. Middle East and North Africa and Sub-Saharan Africa were the two regions that implemented the fewest number of transport PPI projects.

As the analysis presented in the Outlook suggest, a great diversification exists among the OIC countries. On the one hand, oil producing countries such as Qatar, Kuwait, and UAE are among the top per capita GDP countries. On the other hand, 21 OIC Member States are classified as the least developed countries by the UN. In such a big diversity, adopting a single policy set applicable to all OIC members is almost an impossible task. Therefore, when drafting strategies, policy-makers should also take into account individual needs of members and abstain from adopting “one size fits all” type of policies and strategies.

The diversity of the OIC countries and availability of various experiences within the OIC region also indicate a considerable potential for cooperation in the transport industry. The success of the process heavily depends on the adoption of a sound policy framework, right cooperative approach, institutional capacity and human resources development, and accumulation of expertise. In that context, there is a great scope of cooperation among the OIC countries for sharing their experiences, best practices, and technical assistance especially for policy formulation and capacity development and for attracting more investments from other OIC countries in their transport sector.

Regarding telecommunications, OIC member countries usually have lower telephone and internet penetration rates compared to the rest of the world. However, there are big differences among OIC countries. While there are some OIC countries with penetration rates close to or even above high income countries, others have only a negligible level of telephone and internet penetration.

Iran is the leading OIC country in terms of fixed-telephone penetration with 38.27 percent and followed by Kazakhstan and UAE. Regarding mobile cellular penetration rates, Kuwait and

Maldives are followed by UAE, Kazakhstan, and Bahrain. OIC countries are generally in a less favorable position in terms of internet penetration compared to fixed and mobile telephony. Average of fixed broadband penetrations among the OIC countries is just 4.3 percent and this is much lower than world average, which is 11.2 percent.

Bahrain, Qatar and UAE are the best performing OIC countries in terms of internet usage rates with values above 90 percent. However, average of internet usage rates among OIC countries is still lower than world average as well as developing countries average.

9. APPENDIX

Table A.1: Classification of OIC countries by region

OIC-Sub-Saharan Africa	OIC-MENA	OIC-Asia
1. Burkina Faso	1. Arab Republic of Egypt	1. Guyana
2. Somalia	2. Jordan	2. Pakistan
3. Nigeria	3. Islamic Republic of Iran	3. Afghanistan
4. Mauritania	4. Bahrain	4. Kyrgyz Republic
5. Benin	5. Morocco	5. Malaysia
6. Cameroon	6. Saudi Arabia	6. Bangladesh
7. Chad	7. Libya	7. Azerbaijan
8. Cote d'Ivoire	8. Algeria	8. Indonesia
9. Djibouti	9. Albania	9. Kazakhstan
10. Gabon	10. Iraq	10. Maldives
11. Guinea	11. Lebanon	11. Tajikistan
12. Guinea-Bissau	12. Tunisia	12. Turkmenistan
13. Mali	13. Turkey	13. Uzbekistan
14. Mozambique	14. Republic of Yemen	14. Brunei Darussalam
15. Niger	15. Qatar	15. Suriname
16. Senegal	16. Oman	
17. Sierra Leone	17. Kuwait	
18. The Gambia	18. Palestine	
19. Sudan	19. United Arab Emirates	
20. Togo		
21. Uganda		
22. Comoros		

Table A.2: LPI scores of the OIC countries

Country	2016	2014	2012	2010	2007
UAE	3.94	3.54	3.78	3.63	3.73
Qatar	3.60	3.52	3.32	2.95	2.98

Liner shipping connectivity index		
Burden of customs procedure, (7=extremely efficient)		
Container port traffic (TEU: 20 foot equivalent units)		
Merchant fleet by flag of registration, number of ships	20	2016
Merchant fleet by flag of registration, tonnage	78	2016
Container penetration (incl. transshipment) TEU/1,000 capita		
Motorways (Km)		
Highways, main or national roads (Km)		
Secondary or regional roads (Km)		
Other roads (Km)		
Total length of roads (Km)	24,000	2000
Paved roads (%)	81	2000
Paved roads (Km)	19,488	2000
Non-paved roads (Km)	4,512	2000
Length of roads by GDP per capita (Km/\$)	37	2000
Road network density (km/1,000 population)	4.47	2000
Density of roads (Km/Km ²)	0.05	2000
Vehicle ownership (vehicle/1,000 population)	162	2013
Estimated road deaths annually	914	2013
Mortality rate [deaths/100,000 population]	17.4	2013
Rail lines (total route-km)	3,115	2014
Rail network density (km/100,000 km ² land area)	663	2014
Rail network density (km/1 million population)	580	2014
Railways, goods transported (million ton-km)	11,992	2014
Railways, passengers carried (million passenger-km)	1,811	2014
Air transport, freight (million ton-km)	0.0	2015
Air transport, passengers carried	2,138,390	2015
Per capita air passengers	0.398	2015
CO₂ emissions of transport per capita		
CO ₂ emissions from transport (% of total fuel combustion)	12.8	2013
Fixed-telephone subscriptions per 100 inhabitants	12.06	2015
Mobile-cellular telephone subscriptions per 100 inhabitants	145.94	2015
Fixed-broadband subscriptions per 100 inhabitants	0.06	2015
Percentage of individuals using the Internet	15.00	2015

Uganda

Population (million people)	39.0	2015
GDP (current million US\$)	26,369	2015
GDP per capita, PPP (constant 2011 international \$)	1,718	2015
Global Competitiveness Index	3.69	2016
Logistics performance index: Overall (1=low to 5=high)	3.04	2016
Quality of overall infrastructure, 1-7 (best)	3.38	2016
Quality of roads, 1-7 (best)	3.48	2016
Quality of railroad infrastructure, 1-7 (best)	1.59	2016
Quality of port infrastructure, 1-7 (best)	2.50	2016
Quality of air transport infrastructure, 1-7 (best)	3.19	2016
Liner shipping connectivity index		
Burden of customs procedure, (7=extremely efficient)	4.02	2015
Container port traffic (TEU: 20 foot equivalent units)		
Merchant fleet by flag of registration, number of ships		
Merchant fleet by flag of registration, tonnage		
Container penetration (incl. transshipment) TEU/1,000 capita	Landlocked	
Motorways (Km)	0	2003
Highways, main or national roads (Km)	13,620	2003
Secondary or regional roads (Km)	27,126	2003
Other roads (Km)	30,00	2003
Total length of roads (Km)	70,746	2003
Paved roads (%)	23	2003
Paved roads (Km)	16,272	2003
Non-paved roads (Km)	54,474	2003
Length of roads by GDP per capita (Km/\$)	300	2003
Road network density (km/1,000 population)	1.81	2003
Density of roads (Km/Km²)	0.29	2003
Vehicle ownership (vehicle/1,000 population)	33	2013
Estimated road deaths annually	10,280	2013
Mortality rate [deaths/100,000 population]	27.4	2013
Rail lines (total route-km)	259	2004
Rail network density (km/100,000 km² land area)	129	2004
Rail network density (km/1 million population)	7	2004
Railways, goods transported (million ton-km)		
Railways, passengers carried (million passenger-km)		
Air transport, freight (million ton-km)	0.0	2015
Air transport, passengers carried	41,812	2015
Per capita air passengers	0.001	2015
CO₂ emissions of transport per capita		
CO₂ emissions from transport (% of total fuel combustion)		
Fixed-telephone subscriptions per 100 inhabitants	0.82	2015
Mobile-cellular telephone subscriptions per 100 inhabitants	50.37	2015
Fixed-broadband subscriptions per 100 inhabitants	0.32	2015
Percentage of individuals using the Internet	19.22	2015

United Arab Emirates (UAE)

Population (million people)	9.2	2015
GDP (current million US\$)	370,293	2015
